rHGH 3.33mg (10iu), Bacteriostatic Water 10ml/vials a set consisting of recombinant human growth hormone (rHGH) and bacteriostatic water, which is used in hormone therapy as well as in supporting regenerative processes and muscle mass development. rHGH is a synthetic version of the natural growth hormone produced by the pituitary gland, playing a key role in growth, metabolism, cell regeneration, and maintaining overall homeostasis in the body.

Benefits:

- **Supports muscle regeneration and growth** – rHGH stimulates the production of IGF-1 (insulin-like growth factor), which is responsible for muscle regeneration and hypertrophy. This makes it frequently used in bulking cycles by both athletes and bodybuilders.
- **Increased fat metabolism**– Growth hormone helps accelerate fat metabolism, assisting in fat burning while preserving muscle mass, which makes it a popular choice in "cutting" and fat-reduction cycles.
- **Improved recovery** – rHGH is also known for its regenerative properties, speeding up recovery after intense physical exertion, injuries, or surgical procedures. It accelerates tissue healing and may assist in treating injuries.
- **Acceleration of anabolic processes** – rHGH has anabolic properties, meaning it stimulates tissue growth and supports protein production, which is crucial in regenerative processes and muscle mass building.
- **Improved skin appearance** – Regular use of growth hormone can improve skin quality, reduce wrinkles, and enhance skin elasticity and density.
- **Optimization of metabolic functions**– GHG improves the functioning of metabolic systems in the body, including better blood sugar control, fat metabolism, and accelerates repair processes in the body.
- **Longer-lasting effect** – The bacteriostatic water included in the kit is used to dissolve the HGH and helps extend its effectiveness after reconstitution. This solution helps rHGH maintain its stability and efficacy over a longer period.

NEXT

Usage:

Growth hormone (rHGH) is widely used to treat growth hormone deficiency in both adults and children. Its growth-stimulating effects are also used by individuals looking to improve body composition, muscle mass, recovery, or overall physical performance.

Preparation for application:

The set contains 3.33 mg (10 IU) of rHGH and 10 ml of bacteriostatic water, which allows for the hormone to be dissolved and prepared for injection. The dosage is precisely measured, enabling it to be tailored to individual needs.

Note:

rHGH is a substance that should only be used after consulting with a doctor, especially for individuals who do not have a medical indication for its use.

The use of growth hormone carries risks of side effects such as joint pain, water retention, and organ enlargement, so it is crucial to strictly follow dosage recommendations.

rHGH 3.33mg (10iu) with Bacteriostatic Water is an advanced set designed for growth hormone therapy, supporting recovery, muscle mass increase, and overall physical performance enhancement. It is a popular choice among athletes and individuals looking to optimize their training results and improve their physique.
